Probability of Identifying Sites with  
Non-conventional SAM Configuration during Routine Search

NPIC is highly confident of its ability to identify SAM sites with non-conventional configurations during specific SAM searches or during MCI exercises. This is based on the fact that a number of irregular sites have been identified to date in the Sino-Soviet Bloc. The most recent four SAM sites identified in China have been first reported by NPIC utilizing the SAM search policy now in effect. Two of these four Chinese sites are not conventional in their configuration.
